# Chapter 1 Introduction

## What is the SiteLok login with custom field plugin?

The SiteLok login with custom field plugin is an add on for SiteLok that adds an extra layer of security to the login process. As well as the username and password normally required the user will also be asked to enter a memorable word stored in one of the custom fields. If you choose to require the whole word to be entered each time the user will see this extra login page after they pass the username and password form.

If you instead choose to require randomly selected characters to be entered each time the user will see this extra login page.

This extra layer login level can be enabled for all all users, selected groups or selected users.

## Chapter 2 Installation

### Installing for the first time or upgrading

- 1) Extract the contents of the zip file to your PC.
- 2) Upload the plugin\_customlogin folder to your existing Sitelok slpw folder using FTP. There are no special permissions required on most servers.
- 3) Login to the Sitelok control panel.
- 4) Open the following URL in the browser

[http://www.yoursite.com/slpw/plugin\\_customlogin/install.php](http://www.yoursite.com/slpw/plugin_customlogin/install.php)

which will start the installation process. If all is well you will be taken to the plugin preferences page where you will see the plugin listed.

If you have any problems with installation please let us know so that we can help you.

### Disabling the Plugin

To disable the plugin select **Plugin Preferences** in the **Plugin** menu option of Sitelok. Uncheck the enable box for the plugin and click the **Save** button. You can enable it again in the same way.

### Uninstalling the plugin

To permanently remove the plugin and its settings follow these steps.

- 1) Disable the plugin as above.
- 2) Click the delete icon next the plugin in the disabled plugins section.
- 3) Confirm the action in the alert box.

If the plugin is uninstalled successfully you will be returned to the plugin preferences page.

# Chapter 3 Using the plugin

## Configuring the plugin

Before you can have use the login with custom field plugin you need to configure some settings.

You can access the plugin configuration by selecting **Custom Field Login** from the **Plugins** menu. This will display a page like this.

**Login with custom field plugin**

**Settings**

Select field **Custom2 - Memorable Word**   
This custom field will be used for the extra login

Minimum length **4**   
This will force the user to enter at least this number of characters

Characters allowed **abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789**   
List all characters allowed to be used for the custom field

Characters required **All**   
Number of characters user must enter to login. Select All for text field.

Ignore case

**Apply to usergroups**

Check a usergroup to apply this login method and uncheck to remove leaving just the default login. Login methods directly applied to specific users are not affected by this.

ADMIN   
ADMINTEST   
BRONZE   
GOLD   
SILVER

**Tools**

You can use the Select button below to select all users that have been specifically assigned a login method. You can choose the login method using the radio buttons. This doesn't include users that only use this login method because of group membership.

Select users who have been specifically assigned this login method  
 Select users who have been specifically assigned the normal login method  
 Select users who have been specifically assigned any login method

**Select**

**Save**  **Cancel**

## Select Field

This tells the plugin which custom field it will be using for the memorable word that the user needs to enter during login. You should set the title for this field to something suitable such as 'Memorable Word'. You must of course also make sure that you store a value in this field by requesting it from the user in a registration form.

### Minimum Length

This defines the minimum length that is allowed when a user enters a value for the custom field in a registration form or modify profile form.

### Characters allowed

This defines the characters that are allowed in the custom field. By default alphanumeric fields are allowed.

### Characters required

This sets how many characters from the memorable word custom field are required during login. If you select all then the whole word needs to be entered in a text box on the extra login form that by default will look like this.

The screenshot shows a blue login form with the title "Login" in white. Below the title is the instruction "Enter your Memorable Word". There is a white text input field containing the placeholder text "memorable word". At the bottom of the form is a blue button with the text "Login" in white.

If you select a specific number then the extra login form will request that number of characters from random positions in the word using drop down boxes. In this case the default extra login form will look like this.

The screenshot shows a blue login form with the title "Login" in white. Below the title is the instruction "Enter the following characters from your Memorable Word". There are three character selection dropdowns labeled "1", "2", and "5". Each dropdown shows the letter "a" and a downward arrow. At the bottom of the form is a blue button with the text "Login" in white.

### Ignore case

Check the box so that case is not important. This would allow a user to enter London or london for example. It is usually a good idea to check this box.

### Apply to usergroups

Check the box next to the usergroups that you want to use this login method.

If a user is a member of one of the selected usergroups they will be required to use the Custom Field login to access the site.

For example you could require that only ADMIN users are required to use this extra security.

### Tools

The tools section of the page allows you to select in the main admin page the users that are using the login with custom field method. This is useful if you wish to email them all for example.

You can also select users not using this login method or users assigned any extra login method.

Just choose which group of users you want to select and click the **Select** button. This will return you to the main admin page with the relevant users selected.

### Applying to individual users

As well as assigning usergroups to use the login with custom field login method you can also apply it (or remove it) from specific users. To do this click the

icon next to the user you wish to modify or select multiple users and click the icon at the bottom of the main admin page.

This will display the following page.

### Login with custom field plugin

#### Apply login method

Select an option to apply or remove the custom field login method for the user admin?

- This user should always use this login method
- This user should use the login method defined by group membership
- This user should use the normal default login

Set

Cancel

This page allows you to define whether the user should always use the custom field login, use the login defined by the usergroup or use only the default login. Select what you require and click the **Set** button.

# Chapter 4 Customizing

## Customizing the login template

For most sites the default custom field login form that appears will be fine. If you are using Sitelok V4.2 or above it will use the styles you set for the default main login form. However if you wish to make your own then read on.

First of all you need to determine which type of form you need to use. If you request the whole memorable word from the user then you need to use the text field template. If you request random characters from the memorable word then you need to use the Selected Character template.

**Important.** You must make sure your template matches the settings to define in the plugin configuration. If you get something wrong and can't login just delete the template file so that the default is used again.

### Text Field Template

To replace the default login template you need to upload to the plugin\_customlogin folder a file named extralogintemplate.php.

Basically the only requirement is that you create your extra login form using the following <form> tag

```
<form name="siteloklogin2" action="<?php echo $startpage; ?>"  
method="post" autocomplete="off" >
```

and that you include a text field to collect the memorable word from the user. This should be named [extralogindata1](#). So for example

```
<input class="loginbox" type="text" name="extralogindata1" >
```

You can use the example extralogintemplatetextfield.php from the zip file as a starting point if you wish. Rename this as extralogintemplate.php to use it.

## Selected Character Template

To replace the default login template you need to upload to the plugin\_customlogin folder a file named extralogintemplate.php.

The login form on your page should use the following <form> tag

```
<form name="siteloklogin2" action="<?php echo $startpage; ?>"  
method="post" autocomplete="off" >
```

Then you need to have an input field for each of the requested characters. So if you selected to require three characters then you will need three input fields. These should be named [extralogindata1](#), [extralogindata2](#) and [extralogindata3](#). These fields can be text fields or drop down fields. If you use drop down fields make sure the select input lists all of the characters allowed as options.

As the plugin will randomly select which characters need to be entered you also need to display this to the user. The selected character number can be displayed using `<?php echo $charpos[1]; ?>`

So for our example requiring three characters you would need to use

```
<?php echo $charpos[1]; ?>
```

```
<?php echo $charpos[2]; ?>
```

```
<?php echo $charpos[3]; ?>
```

These can be inserted wherever you wish on the page as needed.

You can use the example extralogintemplatedropdown.php from the zip file as a starting point if you wish. Rename this as extralogintemplate.php to use it.

## PHP variables

For more advanced users there are a number of PHP variables you can use in the extra login form. To use these you will need some experience with PHP.

**\$charsreq** This contains the number of characters required as set in the plugin configuration. If it contains 0 this means the whole word is required to be entered using a text field.

**\$selectchars[1]** This contains the first random character position required. Replace the [1] with [2] or [3] etc for the other characters.

**\$selectchars** Contains the list of allowed characters defined in the plugin configuration.

**\$pluginURL** Contains the URL to the plugin folder such as `http://www.yoursite.com/slpw/plugin_customlogin/`

We have included in the zip file an example template called `extralogintemplateauto.php` that uses the above variables that can handle automatically any type of template defined in the plugin configuration.

## Text translation

You can change the English text as required by adding these lines to your `slconfig.php`.

```
define("MSG_CUSTOM_LOGIN_INVALIDCHARS","contains invalid characters");  
define("MSG_CUSTOM_LOGIN_TOOSHORT","is too short. Minimum length is ");
```

## Chapter 5 Support

Hopefully if you have followed this manual carefully everything will be working fine. However sometimes things don't go quite so smoothly so if you have any questions or problems then please check the FAQ on the support page or email us.
