Chapter 1 Introduction

What is the Sitelok Register Code plugin?

The Register Code plugin requires a user to enter a one use code during registration which is checked against the list of valid codes by Sitelok. In other words this plugin lets you have a publicly visible registration form on your site but allows you to control who can register using it. The code can be used to simple allow registration or can be used to determine the usergroup(s) the user is added to.

Codes can also be used in update profile forms to add users to new usergroups as well if required.

Here are some example scenarios

- A unique code could be included with a book which allows the reader to register for access to a supporting website. This ensures that only users who have purchased the book can register.
- Codes can be sold to allow a user to register or be added to a usergroup. As this happens offline it means you can even sell access using a cash transaction.
- Codes could be printed on scratch cards allowing the user to pay for access.
- If you have a list of users from an existing offline system you can use the list of membership numbers (employee numbers or other identifiers) allowing the users to register themselves. This way you can collect their email address and other data that you may not already have but still block others from registering.

The code is validated during registration and stored in a Sitelok custom field after it has been accepted. It is then removed from the list so that it can't be reused. An optional alert email can be setup to warn when the list of codes is getting low.

Please note that usergroup based codes requires Sitelok V4.5 or above.

Chapter 2 Installation

Installing for the first time or upgrading

- 1) Extract the contents of the zip file to your PC.
- 2) Upload the plugin_registercode folder to your existing Sitelok slpw folder using FTP. There are no special permissions required on most servers.
- 3) Login to the Sitelok control panel.
- 4) Open the following URL in the browser

http://www.yoursite.com/slpw/plugin_registercode/install.php

which will start the installation process. If all is well you will be taken to the plugin preferences page where you will see the plugin listed.

If you have any problems with installation please let us know so that we can help you.

Disabling the Plugin

To disable the Register Code plugin select **Plugin Preferences** in the **Plugin** menu option of Sitelok. Uncheck the enable box for the plugin and click the **Save** button. You can enable it again in the same way.

Uninstalling the plugin

To permanently remove the plugin and its settings follow these steps.

- 1) Disable the plugin as above.
- 2) Click the delete icon next the plugin in the disabled plugins section.
- 3) Confirm the action in the alert box.

If the plugin is uninstalled successfully you will be returned to the plugin preferences page.

Chapter 3 Using the plugin

Click the Register Code option in the Plugins menu to display the settings page. This is split into three sections. Remember to click the **Save** button to save any changes.

Settings

Here you can define the main settings for the plugin.

The screenshot shows a settings window titled "Settings" with the following fields and options:

- Custom field to use:** A dropdown menu with "Custom 1" selected. Below it is the text: "The custom field that will collect the code from the registration form. Selecting None will disable code checking".
- Alert when less than:** A text input field containing "20" followed by "codes left". Below it is the text: "Set to 0 to disable alert email".
- Alert email template:** A dropdown menu with "registercodesalert.htm" selected. Below it is the text: "Email template to send when minimum codes left limit is reached".
- Alert email address:** A text input field containing "you@yoursite.com".

At the bottom of the window are two buttons: "Save" and "Cancel".

Custom field to use

Select the custom field which will be used to collect the register code in the registration or update profile form. If you select none then no codes will be validated.

Alert when less than

When the number of codes left reaches this level an email alert will be sent out reminding you to import some more. If you set this to 0 then no alert email will be sent.

Alert email template

Selects the email template to send out for the alert. We have provided a simple example called registercodesalert.htm which you can copy to the slpw/email folder.

Alert email address

The email address to send the alert to.

Upload code list

This section allows you to upload the codes that you will accept for registration. You can also see how many codes are still left in the list.

Upload code list

Here you can upload codes to append to or replace the existing list. Each code must on a line in the text file.

There are 10 codes remaining

Append codes to existing list
 Replace existing codes

Choose File no file selected

Upload

The list should be a text file with one code per line. Each code can contains any characters but must be less than 100 characters in length. Normally codes should be unique but if you do have duplicates then each one can be used. To upload just select the files and click Upload. You have the following options.

Append codes to existing list

If you check this option (its the default anyway) then the uploaded list will be added to the existing codes.

Replace existing codes

Checking this option will delete the existing codes before adding the new ones.

Generate code list

This section allows you to generate a list of unique random codes that you can use with the plugin. Of course if you have a list to use already for your application such as employee numbers, scratch card number or other codes then you don't need to use this.

The generator will create a text file that will download in the browser. You then need to upload the file into the plugin. This way we can be sure you have a local copy of the codes being used.

Generate code list

If you already have a list of codes to use (such as employee ID's or scratch card codes) then you can upload those directly. If you just want to use a list of random codes then you can use this section to generate the codes for you.

Number of codes
Generate from 1 to 9999 codes

Code length
Length in characters excluding prefix and suffix (5-99 characters)

Prefix
All codes will start with this value if entered

Suffix
All codes will end with this value if entered

Allowed characters
The characters that will be used in the random portion of the code

Number of codes

You can generate from 1 to 9999 codes

Code length

The length in characters of the random part of the code. 5 to 99 characters.

Prefix

Enter the code prefix. This will be added to start of each code and is useful when using the usergroup related settings.

Suffix

Enter the code suffix. This will be added to the end of each code and is useful when using the usergroup related settings.

Allowed characters

Enter the list of characters to be used in the random portion of the codes.

Usergroup based codes

If you are using Sitelok V4.5 or above then you can have the code entered determine the usergroup the user is added to and for how long.

Usergroup based codes

Normally codes will add the user to the usergroup(s) defined in the registration form. However you can override the usergroups(s) using the prefix or suffix of codes. You can also use codes to add users to usergroups in an update profile form too if you wish.

Registration with no code

Update profile with no code

When is add to for days

When is add to for days

[+ add code based usergroup](#)

To allow the code to determine the usergroup we use either the prefix or suffix of the code. So for example you could have codes starting with 001 add the user to the GOLD usergroup and codes starting with pr added to the SILVER usergroup.

To extend an existing user group use the + character in front of the days (e.g. +365).

You can also decide whether the code is required in the form or just used to update the user if provided.

Chapter 4 Add to the registration form

Nothing special is required in the registration form to use the plugin. Just add the custom field you wish to use to the form in the normal way as described in the main Sitelok manual.

Using the built in form designer

The easiest way to add the field to a form is to use Sitelok's built in form designer. Just add the custom field to the form and set it as required if necessary.

Adding to forms created using your own html

Here is an example that the uses custom1 field to collect the register code.

```
<?php require_once("../slpw/sitelokregister.php"); ?>
<html>
<head><title>Register with Code</title></head>
<body>
<?php if ($registermsg!="") print $registermsg; ?><br>
<form name="sitelokregisteruser" action="registerwithcode.php" method="POST">
<?php
registeruser("CLIENT", "90", "registerthanks.php", "user.htm", "admin.htm", "Yes", "YNYYYY");
?>
Name<br>
<input type="text" name="name" size="30" value="<?php echo $name; ?>"><br><br>
Email<br>
<input type="text" name="email" size="30" value="<?php echo $email; ?>"><br><br>
Enter the registration code<br>
<input type="text" name="custom1" value="<?php echo $custom1; ?>"><br><br>
<input type="submit" name="Register" value="Register">
</form>
</body>
</html>
```

Remember to 'allow' the custom field in the form by adjusting the allowed parameter (YNYYYY above).

Changing the error messages

By default **Please enter the registration code** is displayed if the user does not enter a code **The registration code is not valid** is displayed if the code has not been accepted. You can change these by adding the following lines

to your Sitelok slconfig.php file anywhere near the other text messages. Change the text as required (the part in green below).

```
define("MSG_REGCODE_ENTERCODE","Please enter the registration code");  
define("MSG_REGCODE_NOTVALID","The registration code is not valid");
```

Allowing users to register again

Normally users can only register once in Sitelok. However sometimes you may want an existing client to be able to register again when their access has expired and they have obtained a new code. This is possible with Sitelok V4.0 and above by adding `$sdeleteexisting=1` to the snippet at the top of the registration page like this

```
<?php  
  $sdeleteexisting=1;  
  require_once("../slpw/sitelokregister.php");  
?>
```

This will only allow a user whose access is expired to register again.

Remember to 'allow' the custom field in the form by adjusting the allowed parameter (YNYYY above).

Chapter 6 Support

Hopefully if you have followed this manual carefully everything will be working fine. However sometimes things don't go quite so smoothly so if you have any questions or problems then please check the FAQ on the support page or email us.
