Chapter 1 Introduction

What is the Webhooks plugin?

The webhooks plugin allows Sitelok to connect with third party services such as Zapier, Integrately and Make opening up many automation possibilities such as adding new Sitelok users to a mailing service or adding a new row for each new user to a Google sheet.

Events in Sitelok such as a user being added or modified can trigger a web hook call to the service where further actions can be performed.

Also actions on that service can call back to the plugin to perform actions such as adding or modifying a user in Sitelok.

The webhooks plugin has been designed to be as flexible as possible and uses standard JSON payloads for the data tased to or from the services.

Chapter 2 Installation

Installing for the first time or upgrading

- 1) Extract the contents of the zip file to your PC.
- 2) Upload the plugin_webhooks folder to your existing Sitelok slpw folder using FTP. There are no special permissions required on most servers.
- 3) Login to the Sitelok control panel.
- 4) Open the following URL in the browser

https://www.yoursite.com/slpw/plugin_webhooks/install.php

which will start the installation process. If all is well you will be taken to the plugin preferences page where you will see the plugin listed.

If you have any problems with installation please let us know so that we can help you.

Disabling the Plugin

To disable the plugin select **Plugin Preferences** in the **Plugin** menu option of Sitelok. Uncheck the enable box for the plugin and click the **Save** button. You can enable it again in the same way.

Uninstalling the plugin

To permanently remove the plugin and it's settings follow these steps.

- 1) Disable the plugin as above.
- 2) Click the delete icon next the plugin in the disabled plugins section.
- 3) Confirm the action in the alert box.

If the plugin is uninstalled successfully you will be returned to the plugin preferences page.

Chapter 3 Setting up the plugin

Click the Webhook icon in the plugins menu to access the plugin settings.

You will see that there are two main sections. The first sections controls the outgoing webhook calls that occur when events happen in Sitelok. The second section controls the incoming action which are webhook calls that cause actions to happen in Sitelok.

Webhooks called when events happen in Sitelok

Webhooks called when events happen in Sitelok

Webhook Key (optional)

bMy4jt87QIN59ySkaNo7jvKWa1AHHRmz	
----------------------------------	---

User added (sluseradded) 

<input type="checkbox"/>		Test
--------------------------	--	------

User updated (sluserupdated) 

<input type="checkbox"/>		Test
--------------------------	--	------

User deleted (sluserdeleted) 

<input type="checkbox"/>		Test
--------------------------	--	------

User login (sluserlogin) 

<input type="checkbox"/>		Test
--------------------------	--	------

User logout (sluserlogout) 

<input type="checkbox"/>		Test
--------------------------	--	------

User payment (sluserpayment) 

<input type="checkbox"/>		Test
--------------------------	--	------

In this section you can set URL's to call for each event type and also enable or disable it. There is an options web hook key that get sent with the call which you can use to verify the call cam from the plugin (if required).

Webhook key (optional)

Services such as Zapier and Integrately use a unique secret URL which is unknown to others but you can verify the optional webhook key for extra security if required.

The next fields allow you to enable and set a URL for each event type. For example here we have set an Integrately web hook URL that will be called when users get added to Sitelok.

User added (sluseradded)

<input checked="" type="checkbox"/>	https://webhooks.integrately.com/a/webhooks/476	Test
-------------------------------------	---	------

You can click the  icon to access the documentation for the call which includes example JSON data and explanations of each field. When setting up web hooks in services like Zapier and Integrately you can click the test button to send example data. This then allows you to select the data fields that you need. Data is sent as JSON.

User added (sluseradded)

If you set a URL in this field (and enable it via the checkbox) it will be called when a user is added to Sitelok. All of the users fields are sent (except password). Please note this event is not called for bulk actions such as importing users.

User updated (sluserupdated)

If you set a URL in this field (and enable it via the checkbox) it will be called when a user is updated in Sitelok. All of the users fields are sent (except password). The previous field contents and which fields have changed are also sent in the JSON data. Check the online documentation for example data and field descriptions.

By default this web hook is called whenever any changes to the user are made. However you can instead have the call made only when certain

fields are updated (for example their email changes). To do this select **Call web hook only when these fields change** in the drop down and check the required fields.

Call webhook only when these fields change ▼

<input type="checkbox"/> Username	<input type="checkbox"/> Enabled
<input type="checkbox"/> Name	<input type="checkbox"/> Email
<input type="checkbox"/> Usergroups	<input type="checkbox"/> Usergroup expiry dates
<input type="checkbox"/> Custom1	<input type="checkbox"/> Custom2

Please note this event is not called for bulk actions such as importing users or canes mad via the maintenance plugin.

User deleted (sluserdeleted)

If you set a URL in this field (and enable it via the checkbox) it will be called when a user is deleted in Sitelok. All of the users fields are sent (except password).

User login (sluserlogin)

If you set a URL in this field (and enable it via the checkbox) it will be called when a user logs in to Sitelok. All of the users fields are sent (except password).

User logout (sluserlogout)

If you set a URL in this field (and enable it via the checkbox) it will be called when a user logs out of Sitelok. All of the users fields are sent (except password).

User payment (sluserpayment)

If you set a URL in this field (and enable it via the checkbox) it will be called when a user makes a payment via a payment plugin. All of the users fields are sent (except password) along with the payment details.

Incoming actions

Incoming actions

API Key

91te0jdllynlooikw1cws08Pt04gM9w9

Webhook URL

https://www.yoursite.com/slpw/plugin_webhooks/slwebhookapi.php

- Add user (sladduser)** 
 - Update user (slupdateuser)** 
 - Add or update user (sladdorupdateuser)** 
 - Delete user (sldeleteuser)** 
 - Get user (slgetuser)** 
-

In this section you can see the API key and Webhook URL that shall be used for incoming web hook calls. You can also enable or disable each of the incoming web hook functions. We recommend, for security, only to enable the functions you need.

You can click the  icon to access online documentation for each function. Included are example JSON data that should be sent to the Webhook URL and descriptions of each field. Note that you can have the webhook send an email sent to the user and/or the site admin by setting the template file name in the properties

```
"useremailtemplate": "newuser.htm",  
"adminemailtemplate": "newuseradmin.htm"
```

Note that although similar to a REST API you should still use the POST method for all of the functions (not PUT, DELETE etc). You can send the api key either in the Authorization header or by using the apikey field in the JSON.

Add user (sladduser)

This webhook API function can be called to add a new user to Sitelok. For security you cannot add users in the ADMIN or SUBADMIN usergroups.

Update user (slupdateuser)

This webhook API function can be called to update an existing Sitelok user. All fields can be modified apart from the password. For security you cannot add the ADMIN or SUBADMIN usergroups to the user though.

Add or update user (sladdorupdateuser)

This webhook API function can be called to modify an existing users data. If the user doesn't exist then a new user is created. This can be useful where you dont know if a user already exists or not.

Delete user (slideleteuser)

This webhook API function can be called to delete a user. For obvious reasons you need to be careful if you enable this function.

Get user (slgetuser)

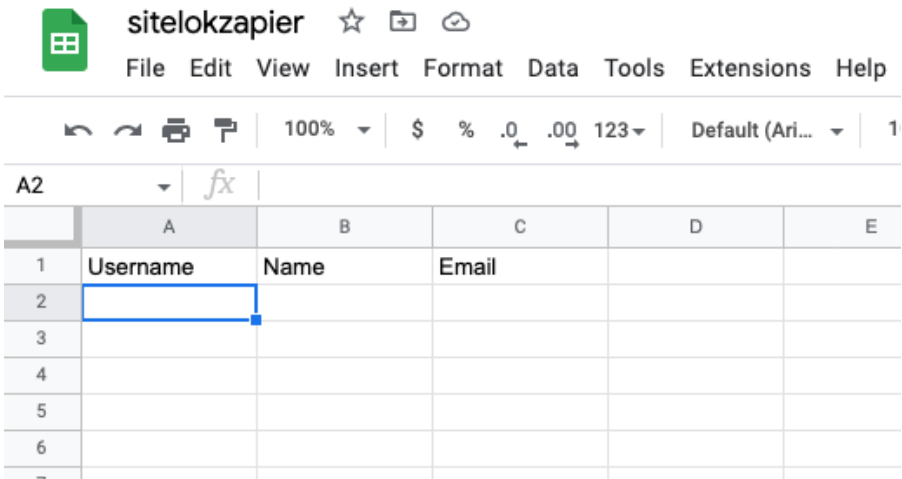

This webhook API function can be called to retrieve a specific users data. All fields are returned except for the password.

Chapter 4 Example using Zapier

This example uses Zapier to add a new row to a Google Sheet when a new user is added to Sitelok (Sitelok calling Zapier). Integrately and other services can be setup in a similar way.

Create a Google Sheet

First of all we need to create a Google Sheet to collect the username, name and email of each user. Enter the column headers in the first row.

Create the Zap and set the trigger

In your Zapier account create a new Zap. We will set the trigger to be a Webhook.

1. Trigger
A trigger is an event that starts your Zap

**Delay**

Pause actions for a certain amount of time

**Filter**

Only proceed when a condition is met

**Format**

Change how incoming data is formatted

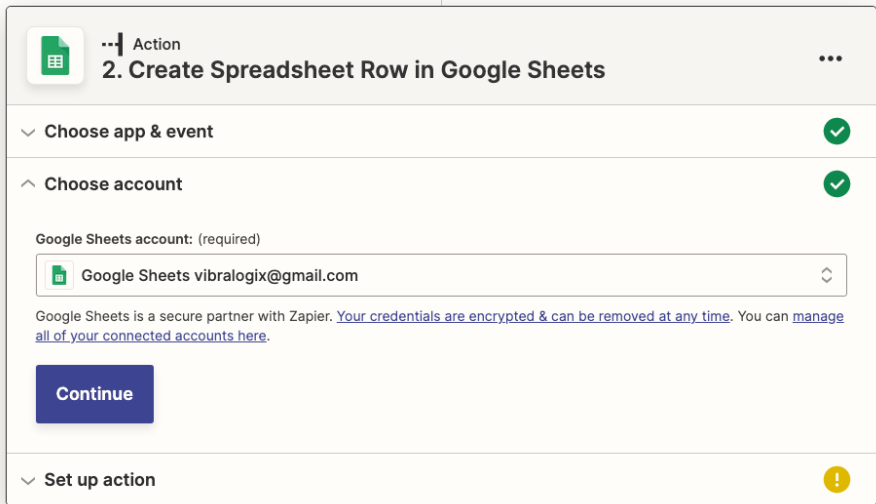

Chapter 4 - Example using Zapier

We now set the event to be **Create Spreadsheet Row**

Connect Google Drive account and choose the spreadsheet

In the Choose account section you can connect to your Google Driveraccount (or select and already connected account).

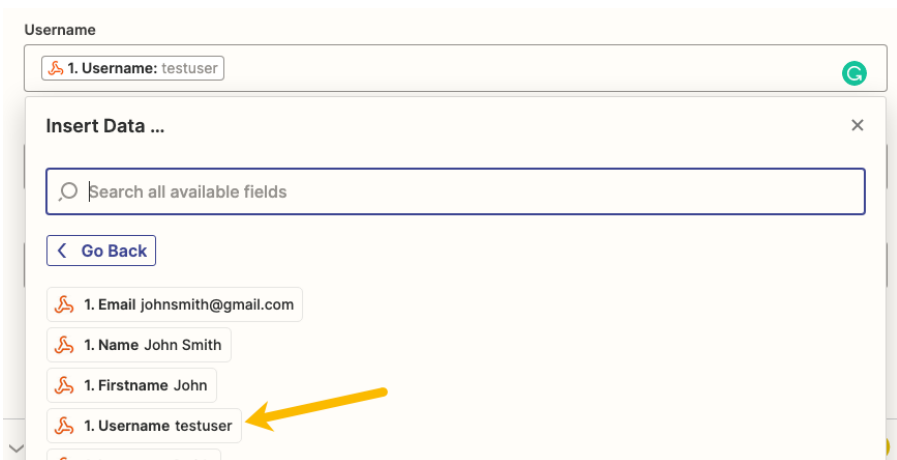

Select the Spreadsheet and worksheet to use.

Set the fields to use

Once you choose your spreadsheet you should see the columns headers appear. For each one you can set the data to insert.

Click in the Username field. Zapier should have received the example text call (when you clicked Test in the plugin) so should show the field list and example data for you to choose from. Select **username**. If not just enter **username** (which is the field we want to store in this column).

Repeat the above for the Name column (**name** field) and Email column (**email** field).

Testing the Zap

In the Test action section click the **Test** button

If everything was setup correctly you should see the example data added to your spreadsheet so its ready to publish.

	A	B	C	D
1	Username	Name	Email	
2	testuser	John Smith	johnsmith@gmail.com	

Chapter 5 Example using make.com

This example shows how to use make.com to call Sitelok (incoming action) to add a user when a new row is added to a Google Sheet.

I setup a Google sheet like this

In Make create a new scenario and add a Google sheet watch rows module setup as in the next image.

During the process you will need to connect make to your Google account and select the sheet to use.

You will also need to specify the column header cells (A1:C1 in this example).

The image shows a configuration window for connecting to Google Sheets. The window has a green header with the text "Google Sheets" and standard window controls. The main area contains several sections, each with a dropdown arrow on the left:

- Connection:** A dropdown menu shows "My Google connection" with an "Add" button to its right. Below it is a lightbulb icon and the text: "For more information on how to create a connection to Google Sheets, see the [online Help](#)."
- Choose a Method:** A dropdown menu with the text "Select from all".
- Spreadsheet ID:** A text input field containing "1FFWcWuoZZr6q12Y3Izl" and a "Search Spreadsheets" button.
- Sheet Name:** A dropdown menu with the text "Sheet1".
- Table contains headers:** A dropdown menu with the text "Yes".
- Row with headers:** A text input field containing "A1:C1". Below it is a lightbulb icon and the text: "Enter the range of the table headers. E.g. **A1:F1**."
- # | Limit:** A text input field containing "1" and a small up/down arrow icon. Below it is a lightbulb icon and the text: "The maximum number of results to be worked with during one execution cycle."

At the bottom left, there is a checkbox labeled "Show advanced settings" which is currently unchecked. At the bottom right, there are two buttons: "Cancel" and "OK".

Chapter 5 - Example using make.com

Now we need to add a new module to make the call back to Sitelok. Choose the **Make module** and select the **Make an API call** option.

In the Make API module you will need to make a new API connection like this.

The screenshot shows the 'Create a connection' dialog box in Make.com. The dialog has a purple header with the title 'Create a connection' and three icons (vertical dots, question mark, and close). Below the header, there are three sections, each with a dropdown arrow and a label:

- Connection name:** A text input field containing 'Sitelok API'.
- Environment URL:** A text input field containing 'https://www.com/slpw/plugin_webhooks/s'. Below the field is a lightbulb icon and the text 'E.g. https://eu1.make.com'.
- API Key:** A text input field containing 'WABvqH35...4yXlcl'.

At the bottom right of the dialog, there are two buttons: 'Close' and 'Save'.

For the environment URL use the full Webhook URL from the plugin page (for example)

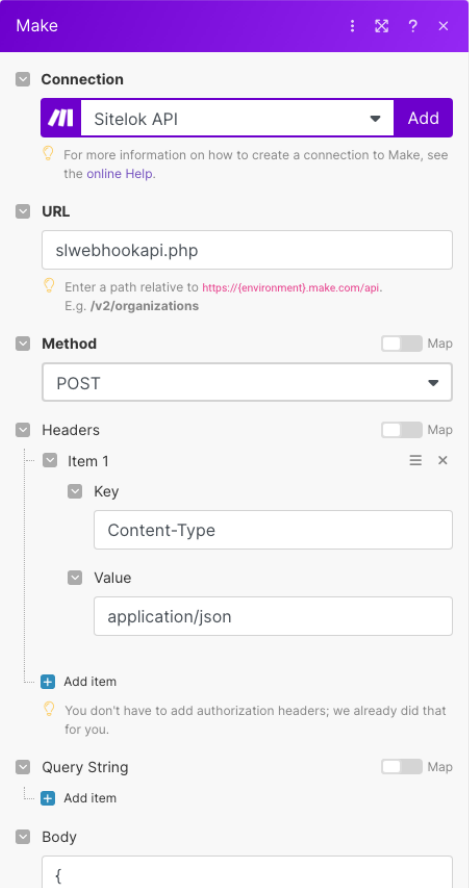

Chapter 5 - Example using make.com

https://www.yoursite.com/slpw/plugin_webhooks/slwebhookapi.php

For the API key use the API key from the plugin page.

When you save the connection it will verify the connection. Note that this connection can be used for other scenarios as well.

Set up the rest of the Make API Call like this. For the URL just use [slwebhookapi.php](#) (without the rest of the URL)

Make

Connection

Sitelok API Add

For more information on how to create a connection to Make, see the online Help.

URL

slwebhookapi.php

Enter a path relative to [https://\(environment\).make.com/api](https://(environment).make.com/api).
E.g. /v2/organizations

Method Map

POST

Headers Map

Item 1

Key

application/json

+ Add item

You don't have to add authorization headers; we already did that for you.

Query String Map

+ Add item

Body

```
{
```

Make 5

Make an API Call

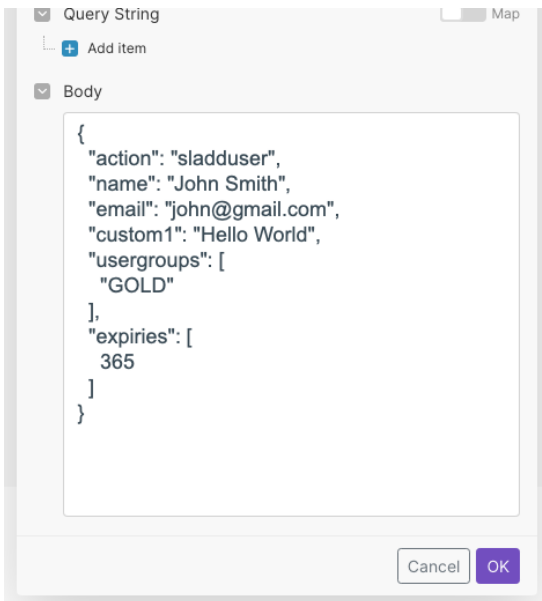

Chapter 5 - Example using make.com

Now we need to make the JSON data to send to the API. Here is an example that will add a new user (see the plugin docs links).

```
{
  "action": "sladduser",
  "name": "John Smith",
  "email": "john@gmail.com",
  "custom1": "Hello World",
  "usergroups": [
    "GOLD"
  ],
  "expiries": [
    365
  ]
}
```

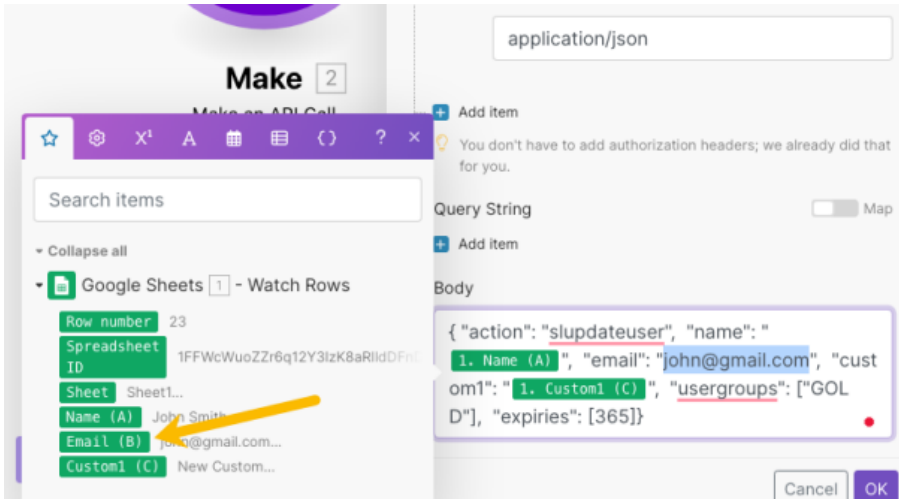

The `apikey` field is not needed here as Make will send it as part of the connection you setup earlier.

Paste the JSON in the **Body** section.

Chapter 5 - Example using make.com

Now of course we don't want to always add John Smith so we need to change the fields we want to the data from the canned row. To do this select the data you want to replace and then choose the column field from the list. For example here we are setting the email from the Email column of the sheet.

Once you have everything setup you can add a row to your Google Sheet and then click the Run Once button in Make to test it.

If you don't see the user added in Sitelok you can click the circle above the Make module to see more information.

Chapter 6 Support

Hopefully if you have followed this manual carefully everything will be working fine. However sometimes things don't go quite so smoothly so if you have any questions or problems then please check the FAQ on the support page or email us.
